A Better Audio & Home Theater Experience

New "DBS" Cables

Are you one of the dwindling few who still thinks "cable is cable"? Then you've probably never listened to Audioquest and you definitely haven't heard what their new DBS technology can do for your system. Each DBS cable has a battery pack which energizes the cable's dielectric with a constant charge in order to "bias" or electrically organize the molecules of the insulating materials within the cable. When the dielectric is charged in this way, the music signal traveling through the cable has a much easier time reaching its destination without the minute distortions that translate into lost detail. The result is a cleaner and more transparent sound and resolution you wouldn't believe your system was capable of producing. New DBS cables require an abbreviated break-in and, from then on, they retain that "warmed up" sound we all cherish. Stop by for an audition or try a loaner pair in your own system.
