New Audioquest Cables!

Audioquest has announced a new line of battery biased speaker cables and interconnects. Speaker cables including CV6, Pikes Peak and Monte Blanc along with interconnects Jaguar, Panther and Cheetah, have been optimized to take advantage of battery biasing.

The battery biasing technique, which has been employed in Vandersteen's excellent Model 5 loudspeakers for some time, involves using a battery to provide a constant charge to the insulation layers surrounding the conductors within a cable. This charge can virtually eliminate any unwanted colorations and interference caused by the dielectric, making it sonically disappear. Battery biasing goes one step further than the "air dielectric" method employed in top-of-the-line cables and achieves a level of openness, clarity and dynamic freedom that cannot be had any other way.

Unlike normal cables, battery biased models will sound completely warmed up or "hot" no matter how long it has been since you last used them. As a matter of fact, no amount of playing your system can equal the kind of "burn-in" that this method achieves.
