STEREO POWER
AMPLIFIER

The new VS power amp series from ARC is a breakthrough in price, performance and style. These beautiful new designs sport an open architecture with exposed tubes for the first time in ARC's history. Both amplifiers have the same basic appearance, but the VS100 is physically larger with a bigger power supply and twice as many output tubes making twice the power; 110 watts per channel vs. 55 wats per channel.

Both use the new Electro-Harmonix 6550 output tubes with their sexy curved glass shape along with an array of 6922s. The VS amplifiers' sonic character is reminiscent of the VT60 and VTM120 power amps of a few years ago, but with the kind of *see-through* transparency that more closely resembles the much more expensive VT100mkIII. Inputs are unbalanced RCAs and outputs are high quality metal binding posts similar to other ARC models. These amps make a wonderful match for any of the current ARC preamps, especially the new SP16 and LS12.

If you've been waiting for a great sounding ARC tube amp that is also affordable, the new VS amps are perfect for you. In our experience, it is rare to find amps that both look and sound this good for such a great price.
