

A Better Audio & Home Theater Experience

## High Definition

When Bill Johnson founded Audio Research in 1970, he may not have done so with the expressed intention of creating a vacuum tube renaissance in the audio world, but that is effectively what transpired. Convinced that the big, glowing glass “bottles” simply made more pleasurable and true-to-life sound than the little solid state blocks found in virtually all audio amplifiers in the late ‘60’s, he committed to designing and manufacturing high quality audio components from these devices at a time when that was tantamount to opening a buggy whip factory. No one could have predicted back then what would follow, but music lovers have ears and the world, gradually, came to embrace Johnson’s credo and recognize Audio Research as the leader in vacuum tube components.

Today, they remain atop the world they originated offering a line of vacuum tube, and solid-state inspired by vacuum tube, components each offering the famed build quality, attention to detail and, most importantly, the sound. Whether the value-oriented SP/VS/VM line, the new multi-channel configurable 150M or the standard-defining Reference Series, every Audio Research component is thoroughly engineered and meticulously assembled to provide years of performance without parallel in the world of High Definition sound. It is a real rarity in the world of audio when the original creator still represents the state of the art two generations later. Audio Research is a shining example.
